

VTC-CSI Release Notes for 11.7.27

Welcome to VTC-CSI! This application has been developed and tested using VTC-Test as the basic testing engine. Every call actually runs thru VTC-CSI using the "Service Provider" option. We are however, realistic in anticipating that there exist scenarios and applications where this implementation could be improved upon. We welcome your feedback in this area to the email address listed below.

System Requirements:

VTC-CSI runs on Windows 98/Vista/7 OS. Nominal memory and disk space requirements.

Installation:

Click on the distributed VTC-CSI.msi file. VTC-CSI demo copy will automatically be installed on your system. If you have a current installed licensed copy of VTC-CSI, this will overwrite the program (not capture or created data) files and you will have a new licensed copy.

Upgrade:

Upgrades should install over top of the older version without losing and data or parameters.

What's New:

- o Added H.261 video details to call ladder.
- o Added Call Ladder options to include/exclude the Legend and the Media visualization from the call ladder.
- o Added "privacy" option on UI to remove sensitive information from HTML file.
- o Added functionality to open the "Output" folder after a file is processed in non-queue mode.
- o Added packet visualization for H.239 packets
- o Added Branding capabilities in to HTML output file.
- o Added capability to include Meta Tags into HTML Call Ladder.
- o Added the table "Observed Performance Summary" to HTML file.
- o "Plumbing" added for RAS messaging capture of all RAS messages including non-call related messages.

Outstanding issues:

None as of this release.

Known limitations:

SIP is not fully decode at this time.

How to contact us:

We have created an email alias that will send all your questions and comments to the VTC-CSI team. We cannot guarantee that we will respond to all of your email, but we do promise to read them.
